1 Introduction

After the game "Lạc trên biển", we participated in another interesting game called "Xây cầu". The goal of this game is to build a bridge using the given materials (6 newspaper pages, a tape, and a scissors). Each team has 8 members. We have 15 minutes to draw the architecture and 30 minutes to build the bridge. Finally, the product will be submitted, and the other team will test the durability of the bridge by putting a water bottle (filled with water) and pushing it to cross the bridge.

In general, the game was extremely fun and has helped me improve my soft skills, especially teamwork and public speaking skills.

2 My opinions

After participating in the game, I gained invaluable experience working under time pressure scenarios. I noticed that the team should have a proper plan before working. Each person has their own job and does it simultaneously, which is a significant advantage when working under time pressure. For example, one person sketches out the architecture, another one measures the size of the newspaper, and the height of the water bottle. Others may prepare tapes and think about how to convert the sketch to a proper bridge.

In reality, my team didn't clearly distribute jobs to each member. Therefore, it was chaos in the building process.

3 Lessons

3.1 Proper plan before working

As I have said before, if the team has a proper plan before starting work, the speed of completion will be increased dramatically. Each member in the team knows their job, and what to do, so no member will be idle while others are working hard.

3.2 Designing

Before building the bridge, we need to design the architecture. Searching and drawing skills are essential in this process. When the team has a general idea,

the conversion will be much easier.

3.3 Material management

The team was only given 6 newspaper pages, one tape, and a scissors. Therefore, material management is extremely crucial. We need to figure out how to build the product with the least amount of materials to prevent material outages.

3.4 Handicraft

The mastery of scissors and tape is key to a smooth build. Precision handicraft skills ensure accurate measurements and fits. This results in a structurally sound and aesthetically pleasing final product.

3.5 Public speaking

After making the product, we need to demonstrate it to other teams and teachers. The presenter has to comprehend the architecture and properties of the bridge before introducing it to everyone.

4 Conclusion

Our outcome in this game was fascinating. Even though the bridge had a bad look with chaos tapes and pages, we were still satisfied with our product. If I could change one thing, it would be creating a plan before working. The process might be less burdensome than before.
